RE: Dust Complaint Investigation, Lyons Quarry M-1977-208

Dear Ms. Milmo:

On Sunday, May 4, 2003 Richard Cargill called the plant on three different occasions to report dust complaints. On each occasion the wind was gusting over 30 mph. The wind pattern was irregular with periods of calm between gusts.

The first complaint call came in at 12:35 p.m. Mr. Cargill described a plume that dissipated very rapidly and wanted to know if we were having problems. At this time the wind was gusting to 32 mph and plant personnel were unable to identify any dust plumes.

The second complaint was called into the plant at 4:46 p.m. Mr. Cargill said he thought the dust was coming from the plant. Our shift supervisor found that the dust was coming from the berms around the CKD pit. The loader operator was placing some dust in a berm so it could be better watered. The wind gusted to 35 mph during this operation. The supervisor stopped the operation and proceeded to water the pit.

The third complaint was called in at 6:24 p.m. Mr. Cargill stated that the dust was so bad he could not see the plant from his house. The control room operator could not see any dust using the site camera. Our supervisor immediately drove to the south end of the plant to a position between the plant and Mr. Cargill's house. He could not see any emissions from the plant or the pit. Our supervisor had our control room operator call Mr. Cargill back in order to better identify the source of the dust. Mr. Cargill stated that the dusting had stopped. At this time the winds were gusting up to 40 mph. Our shift supervisor continued to try and identify any source of fugitive dust until 7:00 p.m. and found there to be no further visible emissions.

During the period of time from noon until 7:00 p.m. our crew put down nine loads of water.

Sincerely,

Steve Mossberg
Compliance Manager
