EMISSION POINTS SUBJECT TO NSPS: Cement Plant (Subpart F)

On February 9 2001, stack testing was performed at the Southdown, Inc. Cement plant in Lyons. The source tested is the Raw Materials Dryer located at the site (AIRS point 002). The source was tested to demonstrate compliance with its permitted emission limits for particulate. The testing was required by a consent agreement signed as the results of a previously failed stack test at the facility. The results of the testing are summarized in the table below.

	Run 1	Run 2	Run 3	Average
Dryer Feed Rate (tons/hr)	150	150	150	150
Stack Flow (dscfm)	30900	31200	32300	31500
Oxygen (%)	18.5	18.0	18.0	18.2
Particulate Emissions (gr/dscf)	0.0044	0.0010	0.0015	0.0023
Particulate Emissions (lbs/hr)	1.16	0.28	0.42	0.62
Particulate Emissions (tons/yr)	4.1	1.0	1.5	2.2

Tons per year values in the table above are based on 7000 hours per year of operation, the operational hour limit on the permit.

The results of the testing show the dryer to be in compliance with its permitted emission limits of 22.8 tons per year of particulate (there is also a PM₁₀ limit of 6.5 lbs/hr and 22.8 tons per year). Natural gas was burned during the testing, since coal was not used as fuel during the year.

A compliance order was signed in October of 2000 for this point. The order requires the source to perform a particulate test within one year of the issuance of the order, and this test fulfills the requirement. Since the results were less than 50% of the permit limit, the source will not have to perform another particulate test during the remainder of the operating permit term.
